

Blu_bot — Summary & Public Readiness Prompt

Paste this into Gemini (or any LLM) for best results

SYSTEM CONTEXT (paste at the top or in the system prompt field):

You are a senior SaaS product analyst and technical reviewer. You will be given a detailed description of an AI-powered WhatsApp business agent platform called **Blu_bot**, built by Bluetick Technology Ltd, a startup based in Lusaka, Zambia.

Your job is to produce two outputs:

1. **A crisp product capability summary** — what Blu_bot can do today, written as if for a product one-pager or investor brief.
2. **A public launch gap analysis** — a prioritized list of what is missing, broken, or incomplete before Blu_bot can safely and confidently be opened to paying customers.

For the gap analysis, rate each gap as:

-  **Blocker** — must be resolved before any public launch
-  **High Priority** — should be resolved in the first release sprint
-  **Nice to Have** — can be deferred to a later version

Be direct, technical, and honest. Do not pad the output. If something is unclear from the description, flag it as an **Unknown / Needs Clarification** item.

USER PROMPT (paste this below, or as the main message):

Here is everything you need to know about Blu_bot:

What is Blu_bot?

Blu_bot is an autonomous WhatsApp business agent SaaS platform built by Bluetick Technology Ltd (Lusaka, Zambia). It allows SME business owners to deploy AI-powered

WhatsApp agents that can handle customer conversations, manage inventory, process orders, send payment links, and more — all through WhatsApp, without the business owner needing to be online.

Tech Stack

- **Frontend:** Next.js 14 (dashboard for business owners)
 - **Backend/API:** Hono (lightweight edge-friendly API framework)
 - **AI Engine:** Gemini Flash 2.0 (primary reasoning and conversation model)
 - **Database:** Supabase (PostgreSQL + Auth + Storage)
 - **Job Queue:** BullMQ (for async tasks — message processing, retries, etc.)
 - **Payments:** Lenco (Zambian fintech for payment link generation and disbursements)
 - **WhatsApp Layer:** waapi.app (WhatsApp Web API) + Meta WABA (WhatsApp Business API)
 - **Architecture:** Two-number setup — one number via waapi.app (unofficial), one via Meta's official WABA
-

What Blu_bot Can Do (Known Capabilities)

- Receive and respond to incoming WhatsApp messages autonomously using AI
- Maintain conversation context per customer session
- Handle business-specific intents: product inquiries, order placement, stock checks
- Manage inventory: products table, stock_movements, orders, order_items (Supabase schema built)
- Generate and send Lenco payment links to customers inside WhatsApp chat
- Multi-tenant SaaS architecture — multiple businesses can each have their own agent
- Dashboard UI for business owners (11-page design prompt completed, covering: overview, conversations, contacts, products, orders, payments, settings, agent config, onboarding, billing, analytics)
- Billing system via Lenco (subscription or usage-based — TBD)

- Meta developer app and WhatsApp Business API configured and set up
-

What Is Known to Be Incomplete or In Progress

- Dashboard UI: designed but not fully built/coded
 - Agent config panel: designed but not implemented
 - Onboarding flow for new business owners: not built
 - Billing/subscription logic: Lenco integrated conceptually, but payment flows not coded
 - waapi.app integration: in progress
 - Meta WABA integration: configured but webhook handling may not be fully wired
 - No automated testing or CI/CD pipeline in place
 - No production deployment (still in local/dev environment)
 - No documentation for end users or API consumers
 - Security hardening unknown (RLS policies in Supabase, rate limiting, etc.)
 - No error monitoring or alerting (e.g. Sentry, logs)
 - No Terms of Service, Privacy Policy, or compliance docs for data handling
-

Target Market

Zambian SME business owners who use WhatsApp as their primary sales and customer communication channel. Early adopters are likely informal retailers, service providers, and small shops.

Instructions for Your Output

Structure your response exactly like this:

What Blu_bot Can Do Today

[2–4 paragraph summary. Be specific. Use plain English.]

What's Missing Before Public Launch

Blockers

- [item] — [why it's a blocker]

High Priority

- [item] — [why it matters]

Nice to Have

- [item] — [brief note]

Unknowns / Needs Clarification

- [item]

Recommended First Launch Scope

[In 3–5 bullet points, what is the smallest version of Blu_bot that could be safely opened to 5–10 pilot customers?]

Be honest. Be technical. Be useful.
